                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               incorporated into a plasmid used for the recombinant production of GRB proteins. Using a new cloning technique, CORT (cloning of receptor targets) several new TK binding proteins were isolated. Growth factor receptor bound proteins GRB-1,GRB-2, GRB-3, GRB-4, GRB-7, and GRB-10 were isolated using this method. The proteins bind to a tyrosine-phosphorylated domain of a eukaryotic TK. GRB proteins can be used for screening agents which are capable of medulating cell growth that occurs via signal transduction through TKs. Such agents can be used to prevent or inhibit cell growth or to counteract tumour development. GRB proteins are also useful for identifying susceptibility to diseases asociated with alterations in cellular metabolism mediated by TK pathways e.g. cancer and diabetes.
 vector for producing heterologous polypeptides in a halobacterial host.

```
A recombinant vector in which a DNA sequence encoding at least the generic lactoferrisin antibacterial peptide AAR88216 is inserted, pref. downstream of the vector's regulatory sequence, is claimed. The protease fragment AAR88219 and the DNA sequences AAT08774-79 were used in the construction of such a vector, where the regulatory sequence is the tac promoter from shuttle vector pGEX2, the GAL1 promoter from vector pKOM2 or Rous Sarcoma Virus long terminal

                                                                                                                                                                                                                                 The recognition sequence (AAR83116) for Factor-Xa may be included in the linker segment of a fusion protein, comprising e.g. calcitonin and alpha-lactalbumin, produced in the milk of a transgenic mammal. Cleavage of the fusion protein with Factor-Xa yields alphalactalbumin, which is removed by an affinity method, and purified calcitonin of therapeutic appln. Alternatively, the linker comprises the activation peptide (AAR83118) of trypsinogen, which includes the recognition sequence (AAR83117) for enterokinase.

                                              The peptides given in AAR73942-44 are used in endotoxin-specific assays in which clotting enzymes, formed in cascade reactions initiated by addition of endotoxin, hydrolyze an amide bond in the peptides, thereby liberating chromogenic p-nitroaniline.
                                                                                                                                                                                                                                                                           ó

Patent No. 5635371

GENERAL INFORMATION:
APPLICANT: Stout, Jay
APPLICANT: Coolidge, Thomas R.
APPLICANT: Holmquist, Barton
TITLE OF INVENTION: CHEMICAL METHOD FOR SELECTIVE
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT
TITLE OF INVENTION: ALPHA-CARBON REACTIVE GROUP OF A RECOMBINANT AND ALPHA-CARBON REACTIVE OF A RECOMBINANT AND ALPHA-CARBON REACTIVE OF A RECOMBINANT AND ALPHA-CARBON REACTIVE OF A RECOMBINANT AND ALPHA-CARBON 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;

The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 414 cells. The method involves contracting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ACTGGAACATGGAGACATCACTTTGAAAGGATACAATTTGTCCAAGTCAGCCTTGCTGAG 2180

They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the
               Single exon nucleic acid probes for analyzing gene expression in human

```
(SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                              2480
                                                                                                                                                                                                 Probe #2910 for gene expression analysis in human cervical cell sample.
                                                                                          2541 AGAGAACAGTAGAATGGAGGAAAATGCTGAAAATCACATAGGCGTTACTGAAGTGTTACT 2600

The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1701 AGGIGCCIATAGIGACAATCCAATAATICGACAIGCITCIATIGCCAACAAGIGGAAAAC 1760

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, prollferative breast disease and
                                                                               Probe; human; breast disease; breast cancer; development disorder; ss; inflammatory disease; proliferative breast disease; non-carcinoma tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     non-carcinoma tumours.
Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel single exon nucleic acid probe used to measuring gene expression in a human breast \cdot

```
The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of from human lung comprising single exon nucleic acid by the sample derived from the 12387 open reading frames derived from the 12614 complements or the 12387 open reading frames derived from the 12614 probes; Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a probes; the novel set of probes which hybridise at high stringency to a collection of detectably labeled nucleic acids derived from human lung comprising (a) contacting the array; identifying exons in a cukaryotic acids derived from human lung menant, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a cukaryotic genome, comprising (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, labeled nucleic acids from eukaryote in my my a single exon probe, comprising (a) identifying exons from genomic sequence by the method above mentioned microarray; assigning exons to a single exon probe in the above mentioned microarray; assigning exons to a single exon probe itssues and/or cell types using hybridisation to a single exon tissues and/or cell types using hybridisation to a single exon tissues and/or cell types using hybridisation to a single exon the exons should be assigned to a single gene common pattern of expression of the exons in the tissues and/or cell types using hybridisation, or encoded by the expression nalysis, and for identifying exons in a gene, particularly cusing human lung derived manalysis, and for the the study of lung diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary hathorytosis, lymphangiolelomyomtosis, pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary alveolar proteinosis, pulmonary dysplasia, primary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a single exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Spatially-addressable set of single exon nucleic acid probes, used to
Hermansky-Pudlak syndrome; sarcoidosis; pulmonary haemosiderosis; pulmonary histiocytosis; lymphangioleiomyomtosis; Karagener syndrome; pulmonary alveolar proteinosis; fibrocystic pulmonary dysplasia; primary cillary dysfinesis; pulmonary hypertension;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 probe of the invention.

agents on cells. The microarray of this invention presents a far greater diversity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to rapid production of functional information from genomic sequence. The present sequence is a single exon nucleic acid probe of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical from WIPO at ftp.wipo.int/pub/published_pct_sequences.

New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes .

The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the

The present sequence is one such probe. The SENPs are derived from human Hela cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the vipo.int/pub/published_pot_sequences.
                             Probe #12148 for gene expression analysis in human cervical cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1105 AGATCATTTTCATGAATTGTATAAAGTGATCCTTCTCCCAAACCAGACTCACTATATTAT 1046

```

```
The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1701 AGGIGCCIATAGIGACAATCCAAIAATICGACAIGCTICIAIIGCCAACAAGIGGAAAAC 1760

The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, inbrocystic changes, proliferative breast disease and
                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                        Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO

complements or the 12387 open reading trames derived from the 12014 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung a collection of detectably labeled nucleic acids derived from human lung a collection of detecting at least one exon from genomic sequences (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably classing a fragment identical to the predicted exon, the probe is included a nucleic acids from eukaryote lung mRNA, to a single exon probe, haring a fragment identical to the predicted exon, the probe is included above and (b) measuring the expression of each of the exons in several classing (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several classus and/or cell types using hypridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that cannot an analysis, and for the specification, or encoded by the of 12011 sequences, mentioned in the specification, or encoded by the ordinary mannalysis, and for identifying exons in a gene, particularly using human lung derived mRNA and for the study of lung diseases

couch as asthma, lung cancer, chronic obstructive pulmonary disease.

dibrosis, neurofibromatosis, tuberous sclerosis, deucher's disease, fermannially expensed to a single exons in a gene, particularly immunian pick disease, Hermannian expenses of interesting expenses thermannial expenses of interesting expenses the means of the exons in a gene, particularly expense in expense expenses the expense expenses expenses are used for gene ó The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 hypertension 1701 AGGIGCCIATAGIGACAATCCAATAATICGACAIGCTICTAIIGCCAACAAGIGGAAAAC 1760 1761 CATCCACCTCATAATGCACAGTGGAATGAATGCCACCACAATACATTTAAATCTCACGTT 1820 1821 TCAAAATACAAACGATGAAGAGTTCAAAATGCAGATAACAGTGGAGGTGGACACAAGGGA 1880 1581 AGATCATTTTCATGAATTGTATAAAGTGATCCTTCTCCCAAACCAGACTCACTATATTAT 1640 1105 AGATCATTTTCATGAATTGTATAAAGTGATCCTTCTCCCAAACCAGACTCACTATATTAT 1046 1641 TCCAAAAGTGAATGCCTGCCTTATTCAGCTTTGCAGAAGTAGCCAAAAGAGGGGTTGA 1700 998 1045 TCCAAAAGGTGAATGCCTGCCTTATTTCAGCTTTGCAGAAGTAGCCAAAAGAGGAGTTGA 986 Gaps pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertens and hyaline membrane disease. The present sequence is a single exon haemosiderosis, pulmonary histiocytosis, lymphangioleiomyomtosis, DB 24; Length 1125; 0; probe open reading frame of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at Pred. This sequence represents an expressed sequence tag (EST), and is a polynucleotide of the invention. The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, heamatopolesis regulating activity, tissue growth activity, heamostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition excivity. The EST sequences are also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2894 AAGAATTTGACAAGACGTCATTTCACAAAGTGCGCCATTCTGAGGATATGCAGTTTGCCT 2953

The SESTs can be used for gene therapy and in vaccines. The SESTs are useful as probes for the identification and isolation of full-length cDNAs and genomic DNA molecules which correspond to the SESTs. Proteins encoded by the SESTs are useful in assays for determining biological activity and raising antibodies. They may be useful for treatment of autoimmune disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated polynucleotides, and encoded proteins, comprising secreted expressed sequence tags (SESTs), useful for treating various disorders such as autoimmune, infectious, and central nervous system disorders -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAA43426 to AAA45925 represent specifically claimed secreted expressed

corresponding and for determining the phenotype of calls from (1) and possed in cancer tissues. ABB/9931 to ABB/9004 represent proteins encoded by the ABG0776 to ABG00787 nucleic acid sequences. (1) can be used in antisense therapy. An antibody immunocactive with a polypeptide encoded by (1) is useful for detecting cancer in a patient sample, and for detecting the presence or absence of a polynucleotide encoded by a nucleic acid which hybridises to (1) in a cell. A probe/primer derived from (1) can be used for determining the presence of a nucleic acid which hybridises to (1), and for determining the phenotype of cells in a sample of calls from a patient. (1) is useful for determining the presence of colon cancer in a cell or tissue type, for determining the presence or state of other type of cancer, in antisense therapy, to generate macroarrays on a soll our tissue type, for determining the presence or macroarrays on a soll surface, to identify a chromosome on which the corresponding gene resides, and in tissue profiling, forensics, genetic analysis, mapping and diagnostic applications. (1) can be used to raise and entagonists.
                                                                                                                                                                                           ABQ56306 to ABQ60787 represent isolated nucleic acids (I) differentially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2035 GCCCAGGAAGAGGTGAAAATTCCCCTGGTAAATATTTCACTCCTTCCAAAAGACGCCCAG 2094
